

# Yaw and Pitch to vector in R3

Depending on your use case you may define the x, y, z in a different way, so I have not included them in this diagram, instead we have up, horizontal and depth, bind them accordingly to your use case.

Trig function definitions:

$$\sin(\theta) = \text{opp}/\text{hyp} \Leftrightarrow \sin(\theta) * \text{hyp} = \text{opp}$$

$$\cos(\theta) = \text{adj}/\text{hyp} \Leftrightarrow \cos(\theta) * \text{hyp} = \text{adj}$$

**Thus, we conclude that the vector representing this yaw, pitch pair is given by an up magnitude of  $\sin(b)$  a depth of  $\cos(b) * \cos(a)$ , and a horizontal magnitude of  $\cos(b) * \sin(a)$**
